Manning Environmental Limited Factory Warranty

Manning Environmental, Inc., warrants this product to the original purchaser against any defects that are due to faulty workmanship or material for a period of one year (365 days) from the date of shipment.

During the warranty period Manning Environmental, Inc. will repair or replace, at its sole discretion, any defective equipment or parts. Manning’s liability is strictly limited to repair and/or replacement. Any product repaired or replaced under this warranty will be warranted only for the remainder of the original product warranty period.

This warranty does not apply to consumable products or consumable components of products such as, but not limited to tubing, intake hose, differential pressure switches and bottles.

Items may not be returned without authorization from Manning Environmental, Inc.

This warranty applies only to products sold under the Manning trademark and is the sole express warranty made by Manning Environmental, Inc. All implied warranties, including without limitation, the warranties of merchantability or fitness for a particular purpose, are disclaimed.

Limitations:

This warranty does not cover the following:

1. Damage caused by acts of God, natural disaster, labor unrest, acts of war (declared or undeclared), terrorism, civil strife or acts of any governmental jurisdiction
2. Damage caused by normal wear, neglect, misuse, accident, corrosion or improper application or installation
3. Damage caused by any repair, attempted repair or modifications not authorized by Manning Environmental, Inc.
4. Any product not used in accordance with the instructions furnished by Manning Environmental, Inc.
5. Freight charges to return merchandise to Manning Environmental, Inc.
6. Freight charges on expedited or express shipment of warranted parts or products.
7. Travel and lodging fees associated with on-site warranty repair
8. Manning 6.1 cubic foot refrigerators, which are covered under the refrigerator manufacturer’s warranty
9. Labor performed at the factory to clean the equipment so that it can be safely and properly repaired

This warranty constitutes the final, complete, and exclusive statement of warranty terms. Manning Environmental, Inc. does not authorize any other person to make any other warranties or representations on its behalf.

In no event shall Manning Environmental, Inc. be liable for any incidental or consequential damages of any kind for breach of warranty or negligence. The remedies of repair or replacement as stated above are the exclusive remedies for the breach of this warranty.

A Return Material Authorization (RMA) must be obtained prior to sending any equipment to Manning for warranty service. Contact the Manning Service Department at:

Manning Environmental, Inc.
1968 South Austin Avenue
Georgetown, Texas 78626
Phone: 512-863-9337, Fax: 512-863-4472.

*Some states within the United States do not allow the disclaimer of implied warranties and if this is true in your state the above limitation may not apply to you. This warranty gives you specific rights- you may also have other rights that vary from state to state.

Manning Environmental, Inc. December 2005

Introduction

Congratulations on the purchase of a Manning Environmental, Inc. Model GC Sampler. The model selected is the latest in a long line of state of the art equipment produced for over twenty three years by Manning Environmental Inc. Based on this experience, if there is one thing Manning can claim it is that we know samplers. There are Manning samplers still used in regular service today that are over twenty years old. It is almost impossible to find an organization with the commitment of producing equipment with such a history of reliability, dependability, quality and value as exhibited by Manning samplers. Even so, improvement is a never ending goal at Manning. We are always interested in the perceptions and experiences of our users. If there are any suggestions or comments on our equipment, this manual, or anything Manning does, please feel free to contact us.

The GC is a stationary peristaltic pump based model which can automatically collect and hold Non-Toxic, Toxic, and Suspended Solid samples from a liquid source. The unit was designed from the ground up with active user participation to ensure the features and options that are important to field use were incorporated into the unit. It employs a high speed, peristaltic pump to draw the samples and an industrial grade refrigeration unit to cool and maintain them at the EPA recommended 4°C. Backed by Manning's reputation for quality and dependability, it will provide years of reliable service.

Even if the sampler will not be used immediately upon receipt, unpack and examine it. This will help to familiarize the user with the equipment. Verify that all of the parts have been received and that no damage has occurred in shipment. If damage is noticed, immediately report the extent of it to both the transportation company and to Manning Environmental Inc. In addition, check the packing list to verify that it matches the items sent and that all accessories ordered are included with the shipment. Manning strives for 100 percent accuracy in the delivery of our equipment, but even with the most stringent quality assurance, mistakes do occur. Omissions, damage, or mistakes must be reported to Manning Environmental Inc. within 10 working days of receipt of the shipment.

This manual is designed to communicate a complete understanding of the equipment, its operation, maintenance, and functions. Manning recommends this manual and the equipment be examined completely before placing the unit into service. Manning's commitment to producing reliable, top quality products is legendary, but the possibility of breakdown or malfunction always exists. This manual should enable the diagnosis and solving of many potential problems. If the problem cannot be solved, please feel free to call our service department at 1-800-863-9337 to obtain help. Our first priority is making sure the experience with Manning equipment is an excellent one. In almost all instances the difficulty can be addressed over the phone, but in the rare instance it cannot, the equipment may need to be sent back to Manning for service. Please contact our customer service department at 1-800-863-9337 to obtain a Return Authorization Number. Then follow the shipping instructions that will be given. Please note the malfunction on the paper work so a diagnosis and a solution to the problem can be arrived at with the least amount of delay.

We recommend the following steps before attempting to use the sampler:

1. Review this manual.
2. Follow the instructions beginning on page 1-8 to assemble the GC.
3. Program the GC.
# Hardware

</table>
### Controller
- Microprocessor based 1 board system which controls all functions of the unit.
- Ergonomically designed, hermetically Sealed, 24 key, multiple function, with 2 line by 20 character alphanumeric backlit display.
- 100% Solid State.
- Indicates real time with ± 1min/month accuracy.
- 5 year internal lithium battery to maintain program logic, RAM memory, real time clock and date.

### Power
- 12 VDC, 7.0 Ah sealed lead acid battery
- 12 VDC, 17.2Ah sealed lead acid battery
- 115 VAC 50/60 Hz power supply
- 230 VAC 50/60 Hz power supply

### Optional Analog Input
- 4-20 mA

### Optional Serial Output
- RS-232 port. Cable is optional

### Sub-Assemblies

The sampler consists of three major sub-assemblies: The top cap, the equipment chassis, the wetted parts kit, and the bottle case. As a unit, these sub-assemblies form an environmental-resistant enclosure.

### Electronics Enclosure

The electronics enclosure includes the microprocessor-based controller, the peristaltic pump, and the liquid sensor. Constructed of ABS, the enclosure conforms to Nema 4X,6 requirements.

### The Controller

The controller electronics consists of 1 board. The board converts outside power to the appropriate internal use and controls the input/output signals associated with the sampler. The CPU board contains a Z180 microprocessor, RAM and ROM memory, and interfaces for the keyboard, and the display. The micro board also contains the logic for the liquid sensor and the RPM counter. The user communicates to the sampler via a 24 key multiple function membrane switch. The keys are clearly marked with their designated functions. An internal battery maintains the program logic, RAM memory, and the controller's real-time clock and date function. The electronics are mounted on the back of the controller.

### Peristaltic Pump

May 1999/Manning Environmental Inc.
The Manning Model GC employs a high speed, dual roller, vertically mounted, peristaltic pump. The pump is belt driven by a 12VDC industrial grade motor. This ensures quite, smooth performance even while the unit is subjected to very intense performance conditions. It utilizes a face plate constructed of clear PVC for easy visual identification of pump parameters, such as tube alignment, and spindle and roller operation. The pump body is made of impact and corrosion resistant Delrin® plastic for long life. It securely holds the pump tubing in place by firmly clamping the two halves of the pump case together. The pump is capable of vertical lifts of up to 28 feet and produces sample transport velocities of 2.0 feet per second over a wide range of draw heights.

**Liquid Sensor**

The Model GC utilizes a liquid sensor, located near the entrance to the peristaltic pump, which is capable of detecting the presence of source fluid as it approaches the pump inlet. The sensor is either a continuity type probe (base) or an ultrasonic sensor (optional). The sensor is held in place by two tube inserts that act to restrict the ability of the tubes to separate themselves from each other. The liquid sensor is used for two reasons:

- It enables the sampler to rinse the intake line. After the initiation of a sampling sequence the first operation is to turn on the peristaltic pump. The pump begins rotating counter-clockwise causing air to be forced out of the intake tubing. After the set amount of purge time has elapsed, the unit will reverse the pump so the rollers are moving in a clockwise direction. This creates vacuum in the pump tube, which in turn causes the source liquid, to begin traveling up the intake line. As soon as the fluid reaches the liquid sensor, the sampler will immediately recognize that fluid has reached the inlet to the pump. It will instantaneously reverse the direction of the pump (rollers will be moving in a counter-clockwise rotation), sending the water that had been drawn up back out of the intake line. This in effect rinses the line. When the unit has performed the set number of rinses, a sample will be drawn. The rinse option is set in *99 (configuration mode). The sampler can be programmed to not rinse the line or to rinse the line up to 3 times.

- It makes it possible for the sampler to deliver precise, repeatable samples even in changing lift conditions. Whenever a sampling sequence is initiated the sampler follows the steps outlined above, and draws a sample. The controller then determines the transit time of the sample to reach the liquid sensor. Assume for example there was an increase in the amount of lift from the source liquid to the unit. This would increase the time needed for a sample to reach the liquid sensor and the pump. The controller, in a case such as this, will automatically compensate for the change in lift by increasing the amount of time the peristaltic pump is able to pull source liquid. This ensures the sampler has enough time to collect the correct amount of sample fluid. The compensation applies to either an increase or decrease in lift height.
Bottle Case

The bottle case serves two purposes. It is a holding area for the bottles and is also a receptacle for ice with which to keep the bottles and samples at the EPA recommended 4°C.

Wetted Parts

Wetted parts are those pieces of the sampler that come in direct contact with the sample liquid. The main components of the wetted parts for the Manning Model GC are the intake hose and strainer, the pump tubing, the discharge tubing, the bottle full sensor and the sample bottle. If the source liquid to be sampled is a non-priority pollutant (Non-Toxic) then all parts that touch the liquid are either PVC (Polyvinyl Chloride), medical grade silicone rubber, ABS (Acrylonitrile Butadiene Styrene) plastic, or Stainless Steel. Parts in contact with a sample source that is a priority pollutant (Toxic) are required to be Teflon®, glass, stainless steel, or medical grade silicone rubber. These materials are recognized and accepted as non-contaminating materials. This permits the sampling of a wide variety of toxic pollutants such as hydrocarbons and chlorine-based compounds.

Intake Hose

The 3/8” ID by 5/8” OD intake hose is constructed of either PVC (Polyvinyl Chloride) or Teflon® lined polyethylene. You can differentiate the hoses by their physical characteristics. The PVC is flexible and slightly tacky to the touch. The Teflon lined polyethylene is not very flexible and is also very smooth and slick to the touch. Standard hose length is 10 feet (3.05 meters). Longer hose lengths can be ordered.

Strainer

The 3/8” ID strainer is available in stainless steel, or PVC. By placing holes no larger than 3/8” ID along the length of the strainer, the intake of large particles that can plug the hose or any part of the sampler is prevented. Since the strainer is also weighted, it keeps the hose inlet at the desired level in the source liquid.

Pump Tubing

The pump tubing Manning Environmental Inc. supplies for the Model GC is medical grade silicone rubber. An optional hi-lift kit is available which uses a long life tube which has a greater coefficient of restitution. It is recommended for those applications where the lift is in excess of 20ft.

**WARNING:** You must use approved silicone rubber pump tubing in the peristaltic pump. Use of other than approved silicone rubber tubing can lead to damage and voidance of the warranty.

Discharge Tubing

The 3/8” ID by 5/8” OD discharge tubing supplied depends on the nature of the application. If it is a Non-Toxic application, normal PVC hose will be used. If
the application is of a Toxic nature, then Teflon® lined polyethylene or medical grade silicone rubber tubing is employed.

**Bottle Full Sensor**

The bottle full sensor is only used on single bottle applications. It is a cylinder, with a hole in the middle, to allow the discharge tube to pass through. Constructed of PVC it has two stainless steel rods that protrude vertically downward from the main body of the sensor. The user positions the bottle full sensor in the container with the ends of the rods at the highest point water should be allowed to rise. Once the water level has risen and contacts the rods, a change in continuity is detected alerting the sampling unit that the liquid in the container has reached the maximum level allowed by the user. This ends the sampling cycle.

**Sample Bottles**

The bottles are constructed of either HDPE (high density polyethylene), or glass. The glass containers are normally used in Toxic applications. The HDPE containers are used in Non-Toxic applications.

Assembly

Assembling the Model GC Sampler

The unit is shipped fully assembled for your convenience.

Installation and Operation Checklist

Prepare the Sampler
A. Install the single bottle kit into the sampler
   1. Install the bottle full sensor
   2. Install the bottle collar
   3. Adding Ice to the bottle case
   4. Checking the pump tubing
   5. Installing the power source
   6. Installing the suction line
   7. Suction line placement
   8. Installing the strainer
   9. Strainer placement
  10. Closing the sampler
II. Installing the sampler at the sampling location
A. Placement of sampler
   1. Selecting the right location
B. Placement of the intake hose and strainer
C. Installation of the suspension harness
D. Installation of the locking harness
E. Connection to external devices

III. Programming the sampler (see the programming section of this manual)
IV. Servicing and maintaining the sampler (see the maintenance section of this manual)
V. Handling of the collected samples

Installing the Sampler

Single Bottle
The model GC sampler is capable of accepting a wide range of single bottles (see page A-7 for a listing). The unit will also have the bottle full wire hard wired into the sampler case. There will be no connector, just a bulk head fitting where the bottle full sensor cable goes. The system should have come with the single bottle discharge spout in place.

Installing the bottle full sensor - To determine when the bottle is full, a bottle full sensor is used. This consists of a PVC ring with two stainless steel leads hard wired into the control unit. The sampler should have been shipped with the bottle full sensor already installed and the bottle full sensor hard wired in. If it was not, follow the instructions below to install.
A. Locate the necessary parts to install the bottle full sensor. This will consist of the bottle full sensor ring, the single bottle discharge spout, and the single bottle retention ring.

B. Locate the control chassis on the sampler. This is the section that has the keypad, peristaltic pump, and LCD display which is attached to the white lid. Remove it from the other pieces of the sampler and turn it over. The bottom of the control chassis should now be exposed.

C. A discharge spout is used on the single bottle unit to position the discharge tube over the mouth of the single bottle. The spout consists of a PVC tube which is press fitted into the opening on the bottom of the control chassis. The discharge tubing then runs through the discharge spout and into the bottle. The discharge spout also helps to position the bottle in the center of the bottle case. The spout should extend down far enough into the bottle, so that if the bottle moves the spout will assist in retaining it in its desired position.

D. Insert the spout through the white spout clamp and push down (the case is inverted from its regular position). You should feel the spout seat (it will not go any further) against its internal stop.

E. The bottle full sensor ring is placed onto the single bottle discharge spout. The sensor ring can slide up and down the discharge spout so that it can be placed in the bottle at the desired level to terminate sampling. If you wish to trigger the bottle full condition earlier, place the ring lower in the bottle. If you wish to have it trigger later, higher.

NOTE: Make sure that the leads from the bottle positioning ring are below the bottom of the single bottle discharge spout. If the leads are not below the bottom of the spout, you may draw fluid out of the bottle during the purge cycle and cause the sampler to not operate correctly.

Installing the bottle collar - The bottle collar is a positive retention device for keeping the bottle centered in the middle of the bottle case. To install, place the bottle collar in the center of the bottle case and align the slots so that the top piece of the unit slides into the bottom unit. Place the bottle in the center. Ice can be added easily after the collar is in place. Once the bottle and ice are within the case, screw the control chassis to the bottle case.

Adding Ice to the Bottle Case - Once you have the spout aligned and the bottles in the bottle case, you have the option of adding ice. In certain cases, ice may not be necessary depending on the nature of the sampling that you are doing. If you wish to add ice, simply place the ice through the center hole of the suspension plate. You may find that adding a small amount of water to the ice will help with cooling the samples. For best results, the smaller the size of the ice particles the better. This allows less air and more iced to be used.

Checking the Pump Tubing - You should always check the pump tubing before commissioning the sampler in the field. The GC sampler utilizes a clear face plate to aid in the inspection of the pump tubing. You will be able to look through the clear plastic face plate to examine the tubing to determine its status and decide on whether that tubing should be replaced. Please see the maintenance section for information on how to set the pump tube count warning which will warn you that the tubing might need to be replaced. The pump tubing is one of the key components of the system. There are several reasons to
check the tubing:

A. Breakage - If the tubing is worn, there is a chance that the tubing could split, tear, or crack during the time the sampler is sampling. If this happens you may not obtain a representative sample. The sampler will also not be at peak performance as any hole or split in the tubing is a suction leak which will decrease the ability of the sampler to draw samples according to its specification. If there is any sign of splitting or cracking, the tube should be replaced (see the maintenance section for information on how to replace the pump tubing).

B. Transport Velocity - As the tubing wears or has buildup (see below) the ability of the sampler to run the same amount of fluid through the tubing diminishes. As this diminishes, the transport velocity will begin to be affected, as the tubing simply does not allow the same amount of volume to pass through per revolution. This in turn can affect the accuracy not only from a sample volume point of view, but also from a representativeness point of view in that the lower the transport velocity, the greater chance of solids settling out of the line.

C. Volume - The longer a tube is run, the less resilient the tubing becomes, meaning its ability to return to its original shape is reduced. Since its original shape has changed, there is also a possibility that the sample volume will be affected as the amount of liquid that can move through the sample tube is reduced. Manning compensates for this through sophisticated software, but the longer the tube is run without being replaced, the greater the potential for inaccurate sample volumes.

D. Buildup - There are a multitude of constituents within wastewater that can cause buildup on the pump tubing. Since there is a constant rolling action associated with the peristaltic pump, a certain amount of collection of material will occur, especially where the rollers are contacting the pump tubing. This can lead to premature wear and also to inaccuracies in sample volumes.

E. Contamination - In those applications where it is imperative that no cross contamination occur, you will want to consider placing a new tube within the sampler.

If you feel the need for checking the tubing by hand, follow the directions in the maintenance section for replacing the tubing. Remove the tubing from the pump and examine it for possible cracks, splits or stress points. If any are noticed, you may want to consider replacing the tubing at that point in time.

**Installing the Power Source** - The sampler is equipped to handle a wide variety of 12VDC power sources. Manning recommends 12VDC @ 7 amps maximum. If you are planning on using your own 12VDC power supply, you must make sure that it supplies the proper voltage to the sampler. Failure to supply proper power could lead to the sampler not working correctly or damage to the electronics.

**WARNING** - Do not connect the sampler directly to AC power sources. The sampler operates off 12VDC power, so AC power must be converted to 12VDC power to be useable. Connecting AC power directly to the sampler will result in damage to the unit and possible danger to the operator. Converters are available from Manning at 1-800-863-9337
INSTALLATION AND OPERATION

</tbody>
</table>

**NOTE**: If you choose to run the sampler using a 12VDC battery and battery charger, so that the battery is continuously trickle charged, you must use a float type battery charger which detects when the battery is fully charged and then limits the amount of current put into the battery. Failure to use a float type could damage the battery and possibly lead to explosive conditions within the battery.

There are several orientations that can be used with the GC sampler. For example, you can have a power supply and a battery in the power supply tray at the same time (not providing power at the same time). This allows the operator a certain amount of flexibility. We encourage you to experiment with positioning to find which meets your needs. To install a battery or a Manning supplied power supply follow the steps listed below:

A. Locate the power supply recess on the top of the control chassis. It has a black nylon strap attached to it to aid in holding down the power supply.

B. Place the desired power supply in the recess and secure with the strap.

C. Attach the power cable from the power supply or battery to the power connector on the sampler, located to the right of the keypad as you face the keypad. The power input connector is a male plug, while all other connectors are female. The connector is also keyed to prevent improper connection.

**WARNING** - The leads from the 12VDC source must be attached to the power port on the sampler with the correct polarity. If the system is not hooked up correctly, it could lead to permanent damage to the sampler and void the warranty for the electronics.

**Installing the Suction Line** - The suction line is the tubing that goes from the source liquid to the fluid sensor before the pump. The suction line is attached to the sampler by the use of a quick disconnect. This allows the operator to quickly and easily detach the hose for cleaning or to move to a different location. The sample tube that is most widely used is a 3/8"ID PVC or vinyl. Teflon lined PVC is also available for priority pollutant sampling applications. The teflon sample line is connected through the use of a special teflon compression fitting. There are several issues about suction line that should be addressed.

A. Always try to have the suction line in whole lengths (4ft, not 4.6ft).

B. Always strive to have the shortest distance between the sampler and the source liquid. If the suction
line supplied is too long, you may want to consider cutting the line from the quick disconnect end to shorten it.

C. Cutting the line - if you choose to cut the intake line, make a clean straight cut.

**Suction Line Placement** - The suction line should always move downward from the sampler in a straight line as possible to the liquid source. Avoid “looping” the line over obstacles, or suspending the line over openings as this will create “dips” which will collect water and which the sampler will not be able to purge out of the line.

**Installing the Strainer** - If a strainer was ordered with the system, the strainer will come attached to one end of the intake line. The strainer comes in two configurations - Stainless Steel and PVC. PVC is generally used in for non-priority pollutant applications and general purpose sampling. Stainless steel is used in priority pollutant applications, or where extremely corrosive liquids are being sampled. If the strainer was not installed on the end of the intake line, you will have to install the strainer. Manning recommends heating the end of the intake line which will be accepting the strainer so that it is pliable. Insert the strainer into the end of the hose and ensure that the barbed fitting on the end of the strainer is seated securely in the hose. With the PVC strainer, you may apply a small amount of PVC cement when placing the strainer into the intake hose, as this will permanently attach the strainer to the hose with little or no chance of losing the strainer.

**Strainer Placement** - Correct placement of the strainer is very important in ensuring that you are collecting the appropriate samples. Whenever possible, place the strainer in the middle of the source liquid, whether this is a stationary body, such as a lagoon, or a moving stream. Positioning the strainer in the middle will collect a more representative sample then either placing the strainer close to the surface of the stream or too close to the bottom. Placing the strainer on the bottom of the channel may lead to an
overstatement of solids. Placing the strainer near the surface may lead to an understatement of solids, but an overstatement of floating material. When placing the strainer in a flowing stream, make sure to place the strainer in the main channel, and not in an eddy or at the edge of the flow. In channels with debris, provide deflection to prevent clogging of strainer holes. The weight supplied with the intake hose is usually sufficient to prevent the intake from being pulled to the surface of a fast channel.

Closing the Sampler - Any time you are going to move the sampler or want to ensure that the unit will be protected from the weather, make sure that the latches on the side of the unit which hold the unit together are latched. These latches are made of stainless steel to resist corrosion.
Locating The Sampler

Place the sampler on a firm, level surface adjacent to the sampling point. Placing the sampler on a slope or steep incline may cause the sampler to miss the mouth of the bottle. With its ABS construction and all stainless steel hardware, the GC is very weather resistant. However, you may want to consider installing the unit in a shelter or under some sort of protection not only for additional protection from the weather but also from vandals. This will improve the performance and life of the unit.

Running A Test Cycle

While it is not mandatory to run a test cycle, it is recommended to assure proper operation and to become familiar with the various functions and modes of operation. Run a test cycle before programming any operational modes into the sampler.

1. Make sure that the power source is installed and plugged into the power port of the sampler. Check the display to ensure that the LCD is responding. The display should read “Sampler Ready”.

2. Submerge the strainer of the intake hose in a container of clean water. The amount of water should be deep enough to keep the strainer covered completely for several test cycles.

3. Press the TEST CYCLE key on the keypad to initiate the test cycle. You will be prompted for the number of samples you want to take. Enter the number and press <ENTER>.

4. You will want to review the programming section which addresses calibration of the unit.

The Sampling Cycle

A diagram of the sampling sequence can be found in the Appendix

There are two types of sample events. The first is time-based. In this type a time interval is defined and the sampler places a sample in each bottle based on that time interval.

The second type of sample event is flow-based. In this type an external flowmeter provides one of two types of signals: a contact closure when a specified amount of liquid has flowed past the measurement point; with the analog option, an analog signal proportional to flow rate.

Whether the sample event is triggered by a flowmeter or by a time interval, the actual sampling cycle is the same. Next, the sampler turns on the peristaltic pump. The pump begins rotating counter-clockwise causing air to be forced out of the intake tubing. This clears the intake hose of any contents or obstructions that may inhibit proper sample collection. After the set amount of purge time has elapsed, the unit will then reverse the pump so that the rollers are now moving in a clockwise direction. This causes vacuum to be created in the tube, which causes the source liquid, to begin traveling up the intake line. If the unit was programmed to rinse, as the source liquid rises in the intake line it will reach the liquid sensor. The sampler will immediately recognize that fluid has reached the inlet to the pump. It will instantaneously reverse the direction of the pump (rollers will be moving in a counter-clockwise rotation), sending the water that had been drawn up back out of the intake line. This in effect rinses the line. If the unit was not set for a rinse the above steps will be omitted. Upon completion of the
last rinse, source liquid will again be drawn up the intake line. The system monitors the flow of liquid and when the preset amount has passed through, the pump will reverse operation again (rollers moving counter-clockwise). This purges excess fluid out of the pump and clears the intake line. Depending on how the unit is programmed or configured, after completing the post sample purge, the sampler will now stop operation or continue performing those functions which it has been programmed. For a complete description of programming the sampler see the programming section in this manual.

### Sample Recovery

Immediate sample recovery is not required since the sampler will automatically shut down when the sample container is full (single bottle only), a pre-set number of samples have been taken, or when the program is complete. However, sample analysis may require quick recovery to maintain sample freshness or to add chemicals.

If the intent is to leave the containers in the suspension plate, caps can be installed over the suspension collars. Remove the suspension plate (with bottles) from the bottle case. To seal the 300ml glass bottles, replace cap liners, then place caps on bottles.

### External Connections

A wiring and connection diagram is located in the Appendix.

Bottle Full

The Model GC can only utilize a Bottle Full Sensor. The connection should already be made. With the single bottle only option, the connection is hard wired in, so that no connection has to be made. Simply attach the leads from the bottle full sensor ring to the leads coming from the upper chassis.

Contact Closure/Pulse

NOTE: The system comes from the factory defaulted to a contact closure input. The system can be modified to accept a pulse input. If you wish to change the system to accept a pulse, please contact the Manning service department for instructions at 1-800-863-9337.
This enables the sampler to accept a contact closure from an external device. The parameter to be measured is set, recorded, and totalized by the external device. When the set limit is met, a contact closure will be sent to the sampler. This in turn will initiate the sample collection process. To connect the external device to the sampler follow the steps listed below:

A) Locate the connector on the electronics enclosure which is labeled "Contact In" (If you purchased the Analog Option, it will be labeled (“Contact/Analog In”). This will have a male plug mated to a female connector with 4 leads coming out of the male end. The chart above describes the color of the leads and which leads correspond to which function for the connector.

B) Wire the leads to the external device's contact closure output.

C) Re-connect the connector to the "Contact In" plug.

This should complete the installation of the contact closure. Test the connection by initiating a closure through the external device to verify the wiring is correct and the sampler is initiating a sampling cycle when a closure is received.

**Analog Signal (Optional)**

With this option, the sampler can accept an external 4-20mA signal from an external device. The flow volume is internally totalized by the sampler’s controller. The analog option is not available as a field retrofit. Contact the Manning Parts Department to discuss a factory modification. To connect the external device to the sampler follow the steps listed below:

A) Locate the connector on the electronics enclosure which is labeled "Contact/Analog In". This will have a male plug mated to a female connector with 4 leads coming out of the male end. The chart above describes the color of the leads and which leads correspond to which function for the connector.

B) Wire the leads from the sampler to the external device's analog output.

C) Re-connect the connector to the "Contact/Analog In" plug.

This should complete the installation of the contact closure. Test the connection through the external device to verify the wiring is correct and the sampler is initiating a sampling cycle when the signal is received. See the *08 Mode in the Programming section for additional information.

This completes the installation of the sampler. The unit should now be operational. Proceed to the programming instructions to program the sampler for operation.

Introduction

The sampler is controlled by a microprocessor that can execute a wide variety of time and flow sampling sequences called Modes. Entries are made through a keypad with prompts displayed on a 2 line by 20 character backlighted LCD (Liquid Crystal Display).

Sampler Configuration

For the sampler to function properly, it must be set-up for the specific application in which it will be used. The *99 Function configures the sampler. Configuration defines multiple variables that do not usually change between different applications. These are such things as the type of sampler (single bottle, multiple bottle, or storm water), the number of bottles, and other factors like draw time, and purge time. Instructions for configuration of the sampler begin on page 2-5.

Sampling Modes

The sampler has two basic Modes: Time and Flow. (NOTE: While referred to as Flow Mode, the sampler can actuate based on signals from any external device. What device or why the device is supplying the closure is transparent to the sampler. The sampler simply registers a contact closure, so actuation can occur based on pH, ORP, Level, Flow, or other parameters. Time mode is based on a preset time period that must pass before a sample is taken. Flow mode has two variants. The standard controller (contact closure option) allows sampling based on contact closures from an external device. The analog controller (4-20mA option) allows sampling based on an analog signal totalized by the sampler's controller. All programs (or Modes) available for the Model YB-38 are based on either Time or Flow. Instructions for programming the different Modes begin on page 2-14.

Single Bottle Modes
   All General Programs (Basic Time and Flow Modes)
   *02 Time Interval Override Mode
   *04 Multiple Time Intervals Mode
   *05 Totalizing Analog Flow Mode
   *06 Totalizing Analog Level Mode
## Utility & Display Functions

<tr>
<td>Low Power</td>
<td>Alerts the user to low line voltage. When this message displays, sampling ceases. Programmed values for the current mode will be preserved by the RAM battery back-up.</td>
</tr>
<tr>
<td>Key Not Active</td>
<td>Indicates the key pressed is not active at the current time.</td>
</tr>
</tbody>
</table>
Display Information

The Manning sampler is capable of displaying a wealth of information through the 2 line by 20 character display. The following describes the functions and how they can be of benefit to the user:

**Time of Day**

The time of day is always displayed in the bottom right hand corner of the display. The format is a 24 hour clock HH:MM:SS. If the display is not counting down the seconds, the controller may have quit functioning. Press <RESET> <RESET> to warm boot the system. If this does not clear the problem, please call Manning at 1-800-863-9337.

**Program Status**

The bottom left hand corner of the display is used for indicating miscellaneous program and functional information. The information displayed here varies depending on the operational status of the active program. The following highlights the function of the display in different modes:

- **Sampler Ready**
  Shows time of day in HH:MM format (24 hour clock)

- **Programming**
  In programming situations, the display is used for entering the data required by the particular mode that is being programmed.

- **Active Program**
  The information displayed depends on the type of program and the status of that program. When a time is shown in this section of the display it is signified by a flashing colon. The time shown may signify time to sample, time override, purge time, draw time, or other times associated with the program. All time displays are in HH:MM format, except for configuration function times (draw time, purge time, measure time, deposit time) and *07 DELAYED SAMPLE EVENT MODE which are shown in MM:SS format. Non time displays are characterized by a 4 digit display which does not posses a flashing cursor. The information relayed here may be the sample number or the bottle number depending on the active program and its state.

- **Configuration**
  See Appendix B for more information.

- **Operational**
  See Appendix B for more information.
Sampler Configuration Functions

There are 3 major configuration functions the user must be concerned with (*99, *20, & *19). Step-by-step programming instructions and descriptions of each function are detailed on the pages that follow:

*99 Sampler Set-Up

*99 allows the user to set the sampler's configuration. For proper operation, it is critical the unit is correctly configured. The memory comes preset with the sampler's defaults. These defaults can be reviewed or changed by entering the configuration mode (explanations and step-by-step instructions are given below). Once entries have been made in *99, re-entering the configuration mode is not necessary unless changes in the data are needed.

Display on LCD | Explanation
--- | ---
SAMPLER READY 04/30 04:30:02 | This display shows the sampler is ready to program. It displays the current time. From here the user can enter any TIME, FLOW, or * Mode. Press the * key to access the * Mode.
ENTER * MODE? | Prompts the user to enter either a program or the configuration function. Press 99 and <ENTER> to configure the sampler.
__ __ | 04:30:02
SAMPLER SETTING? | Sets the sampler to a specific type of operation or bottle configuration:
__ | 04:30:02
1 = Single Bottle
2 = Multi-Bottle
3 = Storm Water Sampling.
Other numbers are not valid and will cause the sampler to malfunction. Enter the desired configuration and press <ENTER>.

# OF BOTTLES? | Sets the number of bottles (1,2,3,4,6,8,12, or 24) in the sampler. If 1 was selected for the SAMPLER SETTING above, this prompt is bypassed. Input the number of bottles and press <ENTER>.
__ __ | 04:30:02
SAMPLE VOLUME? | Sets the sample volume (in milliliters), to be collected per sample.
__ __ __ | 04:30:02
TUBE LENGTH? | Records the length of the sample intake tube.
__ __ __ | 04:30:02
Sets the draw height or lift height of the sampler.

Sets the number of rinses (0-5) the sampler will perform per sample cycle.

This tells the sampler the volume of the current container you have in the system. The volume is set in terms of full liters. So an entry of 00.50 would be 500ml or 1/2 liter. An entry of 15.00 would be 15 liters. This is used in conjunction with the number of samples to be taken so that overfill of the bottle(s) does not occur. For reference the following is a chart with gallons and the equivalent liters:

- 6 Gallons = 23.05 Liters
- 5 Gallons = 19.20 Liters
- 4 Gallons = 15.36 Liters
- 3 Gallons = 11.52 Liters
- 2.5 Gallons = 9.60 Liters
- 1 Gallon = 3.84 Liters

Length of time (3-99 secs) the intake line is purged before a sample is taken. Press <ENTER> to accept the default purge time or input a new 2-digit number. If air bubbles are not coming out of the intake line, or if fluid is visible in the line after the purge has been completed, increase the purge time.

Time window (4-150 secs) during which a sample is drawn. Press <ENTER> to accept the displayed draw time or input a new draw time as a 3-digit number and then press <ENTER>. If the sample fluid does not reach the liquid sensor, increase the draw time.

Sets the auto restart mode: 0 - No auto restart; 1 - auto restart activated. This option will restart the sampler and continue the program that was running, if power fails. It stores parameters, ensures orderly shutdown, and stores enough energy to complete any stepper motor steps in progress.

Sets the test cycle mode. Press <ENTER> to accept the default or input a new number corresponding to the manner in which test samples are to be taken:
- 0 - Only when the sampler is not running a program.
- 1 - In a program, but the sample does not count in the program.
- 2 - In a program, and the sample counts in the program.
Sets whether the display backlights:

0 - Backlight is never on. This is good if power conversation is critical.

1 - Backlight comes on when a key is pressed. The light will automatically turn off after 10 seconds if another key is not pressed.

2- Backlight comes on when a key is pressed and also at the start of a sampling cycle. The light will automatically turn off after 10 seconds if another key is not pressed or another sampling cycle is not initiated.

3- Backlight is always on. This choice will quickly run down a battery.

Creates a password to stop unauthorized access. There are 2 options:

A. Press <ENTER> to accept no password - 0000 (default shown)

B. Enter a 4-digit number at the prompt and press <ENTER>. The user will be prompted to verify the password. Enter the same 4 digits and press <ENTER>. This sets the password.

Note: Use a TEST CYCLE setting of 0 if TEST CYCLE is to be password protected while a program is running.

If the password is forgotten, call the Manning Service Department at (800)-863-9337.

After finishing the Configuration Mode, the sampler will return to the Sampler Ready prompt and the current time will be displayed. Configuration is now complete, and the sampler is ready for programming.
*20 Volume Calibration

*20 calibrates the unit. Calibration is critical to ensure the sampler is drawing the correct amount of sample fluid each cycle. Failure to calibrate the unit could lead to potentially inaccurate sample volumes that can adversely affect the accuracy of the analysis. The YB-38 should be calibrated any time parameters that could affect the performance and accuracy of the unit are changed. This includes changing the pump tubing, varying the intake hose length, changing the sampling location, etc. To run the calibration follow the detailed instructions below. There are a few important items to remember about the *20 Mode:

1) A device to measure liquid volume is required. Direct the discharge side of the pump tubing into the liquid measurement container so the sample will be collected with no spillage. Measure the sample as accurately as possible as the sampler will only be as accurate as the sample volume entered into the system.

2) The unit is pre-programmed to collect a 200ml sample every time a calibration is run. Once the volume collected is 200ml the calibration is complete and the sampler is ready to program.

3) It is best to calibrate the unit at the site where sampling is to take place. This ensures that site parameters, which can affect the accuracy of the sample volume, are accounted for by the unit. If this is not possible, simulate the conditions as closely as possible, before putting the unit into service.

After entering the *20 Mode, the system will prompt the user to start the calibration cycle. After pressing <START> the unit will automatically perform the functions necessary to collect a sample. Make sure the discharge hose is directed into a measuring container. Once the unit has deposited the sample, measure it very precisely, and then enter the volume into the system at the CALIBRATION VOLUME prompt. If the sample size is 200ml the calibration is complete. If it is not re-run the calibration entering the amount of liquid collected into the system each time until the unit collects 200ml. If the unit is not able to match the systems preset volume, check the *99 Mode to verify parameters that could affect the accuracy of the sample volume are entered correctly (i.e., Draw Height, Intake Hose Length, etc.). If they are confirmed accurate, call the Manning Service Department for assistance. The unit will return to the SAMPLER READY prompt after calibration.

<table>
<thead>
<tr>
<th>Display on LCD</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAMPLER READY 04/30 04:30:02</td>
<td>This display shows the sampler is ready to program. It displays the current time. From here the user can enter any TIME, FLOW, or * Mode. Press the * key to access the * Mode.</td>
</tr>
<tr>
<td>ENTER * MODE? ___ ___ 04:30:02</td>
<td>Prompts the user to enter either a program or the calibration function. Press 20 and &lt;ENTER&gt; to calibrate the sampler.</td>
</tr>
</tbody>
</table>
Press <START> to begin the calibration sequence. The unit will purge the line to clear it of any obstructions and to remove residual fluid. It will then begin drawing the sample. Make sure to have the discharge side of the pump tubing directed into a measuring container. The sample will be deposited, and the unit will again purge the line. Measure the sample as precisely as possible.

The sampler will now prompt the user to enter the amount of liquid collected in the container. If the amount of volume is 200ml (the systems’ preset amount) the calibration is complete. If the amount collected is not 200ml, enter the collected amount and re-run the calibration sequence. The sampler uses this information to adjust itself to draw exactly 200ml. If after running the calibration several times, and the sample volume is still not 200ml, check the *99 Mode to verify parameters that could affect the accuracy of the sample volume are entered correctly (i.e., Draw Height, Intake Hose Length, etc.). If they are confirmed accurate, call the Manning Service Department for assistance. The unit will return to the SAMPLER READY prompt after calibration.
*19 Pump Tube Utilities

*19 resets the tube life pump count. A peristaltic unit's ability to operate and perform to specifications, such as transport velocity and lift height, is, to a certain extent, determined by the medical grade silicone rubber pump tubing used in the system. The characteristics of the tubing change as it wears. It becomes less resilient, less able to maintain its shape, develops pinch points on the outside edge of the tube, and as such is not capable of the performance it had when it was new. To maintain optimum performance, it is necessary to monitor the wear on the tube. *19 does this by enabling the operator to set a maximum number of pump revolutions, the tube currently in use, will be allowed to withstand. This, in effect, determines the tube's useful life. Manning recommends not exceeding 1,000,000 pump counts for a singular tube as, by this time, there is risk that the tubing could fail causing a variety of problems. *19 should be used every time the pump tubing is changed. The user will be alerted to change the tubing, when the tubing reaches the number of counts set. The warning will appear, every time the user executes a Program Mode, by pressing <START>. Since all programs are initiated by pressing <START> the warning will always appear, if appropriate, before the program is initiated. This allows the user the opportunity to exit the program and change the tubing. Once the tubing is changed, the user can re-enter the program and begin sampling.

When the pump tubing is to be changed, the user will enter into *19 Mode, just like entering any of the other * Modes. The sampler will prompt the operator to clear the current pump count by pressing 1, or to maintain the current count by pressing 0. It is advisable to reset the pump counts when changing the tubing so an accurate accounting of the number of revolutions, the tube in the pump has experienced, can be obtained. At this juncture the user will be asked to enter a number for the tube life warning which represents the number of revolutions the current tube will be allowed to accumulate before a warning is issued. Once entered, the system will return to the sampler ready prompt and the system will be ready to program.

<table>
<thead>

</tr>
<tr>
<td>__ __ 04:30:02</td>
<td></td>
</tr>
</tbody>
</table>
This prompt is asking the user to determine how the system will handle the current accumulation of revolutions:

0 - Maintains the current revolution count. This is useful if the operator wishes to increase the number of revolutions the current tubing can accumulate before a tube life warning is issued. For example, assume the current tubing has 200,000 revolutions. The operator really wants the warning to come on at 400,000. The 0 key would be pressed instead of 1 to maintain the history the tubing has already generated. The user would then enter 0400 (for 400,000) at the TUBE LIFE WARNING prompt (see below).

1 - Resets the current revolution count. This is necessary if the user is going to be placing brand new tubing into the system. With the counter reset the user knows exactly how many counts it will take for the sampler to issue a warning to change the tubing.

Enter the maximum number of counts the tubing will accept before the sampler issues a pump tube warning. The number entered is in terms of thousands (in other words it adds 3 0's to the end of the number entered) so if 0500 is entered, the sampler would see it as 500,000. Entering 4000 equals 4,000,000 and 0060 would be 60,000, etc. The sampler will then issue a tube life warning when the pump revolutions meet or exceed the set number of pump counts entered in *19.
*91 Data Logging

*91 is the data logging function for the Manning Environmental Inc. sampler family. The data logging function is always active, and will continuously record events and sampler activities as they occur. The system performs a bound checking function on entries. This ensures that entries which exceed the limits placed in the system are not accepted. If this happens a EEEE will appear on the display. The user simply presses <CLEAR> to remove the EEEE and is then able to continue to enter numbers. The unit holds up to 512 entries in battery backed RAM, so in case of power loss the unit will not loose recorded events. If a 513th entry occurs, the unit will display a LOG FULL message and that entry and subsequent events and activities will not be recorded until the log is cleared. The unit will display the collected information upon the 2 line by 20 character backlit LCD display. The data is displayed in a coded format so the maximum amount of information is available on the screen. The codes are explained in the view menu. *91 can only be entered from the SAMPLER READY prompt. The user can reach this screen from any location by pressing <RESET> <RESET>.

### Display on LCD

<table>

</tr>
</tbody>
</table>

| **ENTER MENU SELECTION**<br>__ __ 04:30:02 | Enter the number coinciding with menu to be accessed and press <ENTER>. The following sections will explain each of the sub-menus: |
ID Menu

The ID menu allows the user to identify a site at which the events have been logged and a corresponding date associated with the events at that site. This is represented by a 4 digit number which the user enters in the ID Menu (see below). The system only allows for one site ID at a time. For example, the user enters 1234 as a site ID number and logs 100 samples at that site. Later the sampler was moved to a different site. If the operator enters a new site ID number (5678), the original site ID (1234) will be overwritten with the new site ID number (5678). The operator should download the data before changing site ID numbers in this scenario.

At this prompt input a 1 and press <ENTER>

<table>
<thead>
<tr>
<th>ENTER MENU SELECTION</th>
<th>04:30:02</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENTER 4 DIGIT ID #</td>
<td>04:30:02</td>
</tr>
<tr>
<td>ENTER MONTH MM#</td>
<td>04:30:02</td>
</tr>
<tr>
<td>ENTER DAY DD #</td>
<td>04:30:02</td>
</tr>
</tbody>
</table>

The user enters a 4 digit number that corresponds to the site at which the samples will be taken. Only one site number can be used at a time. Entering a new site number, overwrites all stored site numbers.

This display asks the user to enter the current month in 2 digit format. For example 03 = March, 11 = November, etc...

The user enters the 2 digit number corresponding to the current day. The first day of the month being 01, the last being 30 or 31.
The operator enters the current year in 4 digit format.
View Menu

The view menu allows the user to review logged events and activities. The information recorded is not limited to sampling events. Activities such as power failure, warm starts, cold starts, etc. are also recorded to allow the operator a fuller and more comprehensive understanding of the activities of the unit. The information in the VIEW menu is shown in coded format to allow the maximum amount of information to be displayed in the smallest amount of space.

**TIME**
Twenty four hour clock in HH:MM:SS format.

**EVENT #**
An "E" marks the beginning of information related to Event # and is separated from the Time by a comma. The event number represents the sequential order of the events that have been logged since the operator last pushed <START>. For example E001 would be the first logged event with E512 being the last since the unit logs a maximum of 512.

**BOTTLE #**
Preceded by a "B", the Bottle # is separated from the Event # by a comma. Bottle number indicates the Bottle that the sample was placed into.

**SAMPLE #**
This is the first entry on the 2nd line of the display. It is indicated by an "S".

**TRIGGER CODES**
The trigger code shows the operator what triggered or initiated the sample to be taken. The following shows the letter corresponding to the sample trigger:

- TI = Time Interval
- CC = Contact Closure
- AF = Analog Flow
- FD = Falling Delta
- TY = Test Cycle (Not in a program mode)
- TO = Time Override
- AL = Analog Level
- RD = Rising Delta
- TC = Test Cycle (In a program mode)
RESULT CODES  The result code indicates whether the unit was successful or unsuccessful in collecting the sample. If the sampler was successful, the unit will indicate this with a NE. If the unit did not collect the sample either a BF or NF will be displayed. The codes are as follows:

NE = No Error  
NF = No Fluid  
BF = Bottle Full

ACTIVITY LOG  The unit also logs information about non sampling events such as power failures, start sequences, reset occurrences, etc.. This data is displayed in a different format than the event entries. You are simply shown the time, in twenty four hour format, and the activity (in this example START):

16:04:44,  START

Each time the particular activity is executed (in this case START), the information will be stored in the log. This also applies to reset’s, power failures, etc... The storage of this information increases the users ability to understand the sampling events and how other activities might have effected the sampling program.

DATE STAMP  The sampler possesses the ability to date stamp events that are logged. This stamping occurs in 3 instances:
A.  When a program is started  
B.  When <RESET> <RESET> is executed  
C.  When midnight occurs

The purpose of the date stamp is to allow the operator to know when various events occur and when the happen. The sampler does not log the date with every sample, instead when midnight occurs the date is stamped and each subsequent event, until the next occurrence of midnight, are recorded on that date.

ENTER MENU SELECTION  At this prompt input a 2 and press <ENTER>

__ __ 04:30:02

# OF EVENTS = __ __ __  Shows the operator the number of events recorded. The sampler holds a total of 512 events. This is a momentary display (3 seconds).

04:30:02
The operator is then prompted to enter the point (event #) at which they want to begin the display of recorded events. Input the starting point as a 3 digit number and press <ENTER>

The user is then prompted to enter the number of events they wish to view. Input the number of events to be viewed as a 3 digit number and press <ENTER>. This feature allows the user to view all the logged events, a section of the logged events (300 to 400 for example), or a single event.

To set the scroll seconds, enter a 2 digit number representing the amount of time, in seconds, you wish the display to show a recorded event before advancing to the next screen. After inputting press <ENTER>

The sampler displays recorded events in one of two ways:

A. By entering the scroll seconds, the sampler automatically advances sequentially through the recorded events, showing each event for the set number of scroll seconds. This will continue until the event entered in the COUNT # is displayed. The sampler will then return to the ENTER SELECTION prompt within *91.

B. The user can also manually review the logged events, although scroll seconds still have to be entered. To manually examine the logged events press <DISPLAY> once for each event to be reviewed. If <DISPLAY> is not pressed, the unit will default and use the entered scroll time to advance the display.

This is a momentary display (3 seconds) to remind the user that they can manually advance the log review or that the unit will do it automatically based on the time set at the scroll seconds prompt.
This display is divided into multiple sections to communicate information about the logged sample.

1st Line
1st section - Time at which the sample was collected.
2nd section - Headed by a capital “E”, indicates the event number.
3rd section - Headed by a capital "B" represents the bottle number.

2nd Line
1st section - Headed by a capital "S" indicates the sample number.
2nd section - Trigger Codes - This is a 2 letter code that specifies what initiated the sample. For a complete list of codes, refer to page 11 - TRIGGER CODES.
3rd section - The last section signifies result code. This tells the user whether the sampler was successful or unsuccessful in collecting a sample and why.

To quit viewing data, simply press <RESET> once. This takes you to the beginning of the menu selection in the Data Logging menu. The unit will continue to show the events either based on the scroll time or by pressing <DISPLAY> until the STOP # is reached. At this point the unit will return the operator to the ENTER SELECTION prompt.

Exit Menu
This menu allows the user to exit back to the SAMPLER READY prompt from which other programs or functions can be entered. The only other way to exit the data logging menus is to press <RESET> <RESET>. However, this will be recorded as an activity, whereas using the exit menu will not.

At this prompt input a 3 and press <ENTER>. The unit will execute a warm start and return to the SAMPLER READY prompt.

Download Menu
The download menu is intended to allow the operator to make either a hard copy (by sending the information to a printer) or an electronic copy (by sending the information to a PC or a Data Transfer Unit). The information is in ASCII format and is comma delimited for easier interface with commercially available spreadsheet programs. The Baud Rate is fixed at 9600 with 8 bits no parity and 1 stop bit. The download menu is identical to the VIEW menu. The only difference is that when the data is reviewed, it is also being downloaded to the device of choice.
At this prompt input a 4 and press <ENTER>.

<table>

</tr>
</tbody>
</table>
This display is divided into multiple sections to communicate information about the logged sample.

1st Line
1st section - Time at which the sample was collected.
2nd section - Headed by a capital "E", indicates the event number.
3rd section - Headed by a capital "B" represents the bottle number.

2nd Line
1st section - Headed by a capital "S" indicates the sample number.
2nd section - Trigger Codes - This is a 2 letter code that specifies what initiated the sample. For a complete list of codes, refer to page 11 - TRIGGER CODES.
3rd section - The last section signifies result code. This tells the user whether the sampler was successful or unsuccessful in collecting a sample and why.

The unit will begin to scroll through the entries one at a time either based on the default or on the user pressing the <DISPLAY> key. The information being displayed is also being sent to the data collection device attached to the sampler (i.e. printer, PC, DTU).

### Clear Menu
The sampler is capable of holding up to 512 events or activities in memory. Once the databank is filled, the unit will not store any additional information until the event log is cleared. Once the log has been cleared the information that had been stored there is permanently erased. If the information is critical please review the DOWNLOAD menu above for information on how to save the logged events and activities in either electronic format or hard copy.

At this prompt input a 5 and press <ENTER>
Enter your selection at the prompt:

1. This does not clear the data and will take you back to the ENTER SELECTION prompt.

2. This will clear all data. If there is any data that needs to be retained, make sure a backup exists. Once the data has been deleted it is unrecoverable. After the data is cleared, you will be taken back to the ENTER SELECTION prompt.

### *14 Clear Log Data*

*14 Clear Log Data option allows the operator to clear the logged data without entering the *91 data logging program. This selection does not give the user the opportunity to back-out of the clearing of the log. This is an immediate and unalterable erasure. The *14 clear data unlike the *91 clear data is accessible from the SAMPLER READY prompt.

- **SAMPLER READY**
  - 04/30 04:30:02
  - This display shows the sampler is ready to program. It displays the current time. From here the user can enter any TIME, FLOW, or * Mode. Press the * key to access the * Mode.

- **ENTER * MODE?**
  - — — 04:30:02
  - Prompts the user to enter either a program or the configuration function. Press 14 and <ENTER> to erase the logged data.

- **CLEARING LOG DATA**
  - The menu shows the log being cleared. The log is now clear. The data that was contained within the log is now erased and is unrecoverable.

- **SAMPLER READY**
  - 04/30 04:30:02
  - The unit returns to the SAMPLER READY prompt awaiting further action.
Analog Option Programming

This section explains how to program the sampler if the unit has the optional analog controller. If it was not ordered, it is not necessary to read this section. The analog option allows the sampler to accept an analog signal (4-20mA) from an external device.

When using any of the analog programming Modes (*05, *06, *09, *11, and *13), the sampler will prompt the user to enter an upper and a lower limit. These limits can refer to flow or level depending on the program. The limits are important because of the Analog to Digital converter in the YB-38. The converter allows an analog signal to be divided into 256 (0 to 255) divisions which digitizes the signal. The lower limit will correspond to the lowest signal level (0 Volts in 0-5 Volts, 4mA in 4-20mA, etc.) sent from the external device. The higher limit will correspond to the highest signal level (5 Volts in 0-5 Volts, 20mA in 4-20mA, etc.) sent from the external device. The difference between the lower limit and the higher limit is the span. The processor divides the span into 256 evenly spaced steps.

For example, with a 4-20mA signal, if you set the lower limit to equal 4 ft and the upper limit to equal 44 feet the following values would automatically be assigned to each:

<table>
<thead>
<tr>
<th>Analog Signal</th>
<th>Level</th>
<th>A/D Digital Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>4mA</td>
<td>4 ft.</td>
<td>0</td>
</tr>

<tr>
<td>16mA</td>
<td>34 ft.</td>
<td>180</td>
</tr>
<tr>
<td>20mA</td>
<td>44 ft.</td>
<td>255</td>
</tr>
</tbody>
</table>

Totalizing

When the volts or amps of a signal vary, corresponding to a flow, then the signal can be used to totalize the flow. Each time the analog signal is read, a value is obtained that can be converted into a flow. For example, (using a 4-20mA signal) when the analog signal is 12mA, then we know that the flow rate is half of the total. If maximum flow is 100 and minimum is 0, then the flow rate is 50. The volume units of the number are determined by the volume units of the maximum and minimum flows. If they are in liter then the flow is in liters, if they are in gallons then the flow is in gallons. Flow is volume per unit time, and though the volume unit can be anything the time units cannot. Except for 1 condition the flow unit should be volume unit per minute (gallon/min, L/min, etc), and the interval to check the analog signal should be 1 minute. The exception is when the sampling sequence (time to take and deposit a sample) takes longer than 1 minute. In this case, the time interval between analog signal checks must be increased. When the time interval between analog signal checks is greater then 1 minute, the volume that triggers a sample must be divided by the value of the time interval to function properly.
*08 Analog Display Routine

The analog display routine allows the operator to display the analog signal received from an external meter (level, flow pH, etc.). This routine can be used while the sampler is being installed, connected to a flow meter, or to check the calibration of the sampler’s analog to digital converter.

The program is started by entering <*08> at the “SAMPLER READY” prompt. The analog value will be displayed in three formats: 1) As a digital value (0 to 255); 2) As a DC voltage (1 to 5 VDC); and 3) in milliamps (4.0 to 20.0 mA). The program will continue to loop until reset by the operator pressing the <RESET> key twice. The analog input signal can be varied while the program is running and the display will change accordingly.

The sampler’s analog routine can be calibrated by inputting a known milliamp signal or attaching a variable voltage source across the analog input terminals.

</tbody>
</table>

Table A1 is a conversion table for the analog values. For example, if a voltage of 3.00 volts is placed across the analog input terminals the sampler should display 12 mA, 3.00 VDC and a digital value of 127. The analog input circuit is designed with a precision 250 ohm resistor across the input terminals. When an mA analog signal is input the current flows through the 250 ohm resistor generating a voltage drop proportional to the current flow. At 12 mA the voltage drop is .012x250 = 3.00 volts. The three volts is converted into a digital value 127. When a three volt signal is placed across the analog input terminals it generates a current...
flow according to ohms law of $I = \frac{3}{250} = .012$ mA.

Constant current sources are not common. However, batteries of known voltages are readily available; thus, using a voltage source to calibrate the sampler is useful.

A 4-20 mA source can be calibrated by placing a 250 ohm resistor in the loop and measuring the voltage drop across the resistor with a voltmeter. Table A1 can be used to interpolate the corresponding MA signal or Ohms law ($V/R = 1$) can be used to calculate the mA signal. If the voltage is 4.25, then the mA signal is $4.25/250 = .017$ amps or 17 mA.
Add-On Programming Functions

Delay Start - Time

Delay Start - Time works in conjunction with TIME and certain * Modes to expand the capabilities of the sampler. It is not a stand alone program and cannot be used with * Start, FLOW MODES, *01, *05, *06, *09, *11, *12, or *13. Delay Start - Time works by allowing the user to add a period of time to the beginning of a TIME or * Mode to delay the start of the program. This time period must elapse before the program can begin to operate. **NOTE:** Some programs already have a Delay Start - Time in the program negating the user's ability to add an additional Delay Start - Time. The user selects the mode of choice and enters the required information. The PUSH START/OPTIONS prompt will then appear on the display. At this cue press <DELAY START> and enter the amount of time (in HH:MM format) the sampler is to wait before beginning the program. Once the Delay Start has elapsed, the program will start. For example, if the sampler were programmed with a 9.5 hour Delay Start - Time and a 1.5 hour Time Interval, the sampler would wait for 11 hours until the first sample is taken, (9.5 hours of Delay Start - Time and 1.5 hours for the Time Interval). The sampler would then take a sample every 1.5 hours until all of the bottles (set in *99) each have a sample placed in them or a bottle full condition occurs.

Display on LCD

**Explanation**

<tbody>
<tr>
<td><strong>SAMPLER READY</strong> 04/30 04:30:02</td>
<td>This display indicates the sampler is ready to program. Delay Start - Time is not a stand alone program. It works in conjunction with TIME, and certain * Modes. In this example &lt;TIME&gt; was pushed as the mode of choice.</td>
</tr>
<tr>
<td><strong>ENTER INTERVAL TIME</strong> __ <strong>:</strong> __ 04:30:02</td>
<td>Enter the time interval as a 4-digit number (HH:MM format) and then press &lt;ENTER&gt;.</td>
</tr>
<tr>
<td><strong>PUSH START/OPTIONS</strong> 04:30:02</td>
<td>The program can then be started by pressing &lt;START&gt; or other functions can be added on such as Delay Start - Time. In this example &lt;DELAY START&gt; was pressed.</td>
</tr>
<tr>
<td><strong>ENTER DELAY START</strong> __ <strong>:</strong> __ 04:30:02</td>
<td>This display prompts the user to enter a Delay Start time (in HH:MM format). This is the amount of time the sampler is to wait before starting the regular program (in this case TIME mode).</td>
</tr>
<tr>
<td><strong>PUSH START/OPTIONS</strong> 04:30:02</td>
<td>The sampler is now ready to begin operation. Press &lt;START&gt; to begin the Delay Start countdown, or add other options such as Multiple Samples per Bottle or Multiple Bottles per Sampling Event.</td>
</tr>
<tr>
<td><strong>DELAY START TIME</strong> __ <strong>:</strong> __ 04:30:02</td>
<td>This display shows the time remaining on the Delay Start.</td>
</tr>
</tbody>
</table>
Once the Delay Start has counted down to zero, the Interval Time entered earlier will begin counting down. This display shows the time left to take a sample. As mentioned above, Delay Start - Time works with TIME, and certain * Modes.

General Programs

Time Mode - * Start

* START is a unique programming mode. It is unlike any other mode in that it automatically programs the unit to take a sample every hour. Simply press the * key and then <START>. As soon as <START> is pressed, the sampler begins counting down 1 hour. At the end of that hour the sample sequence will be initiated. The sampler will advance the spout, draw 1 sample, and place it in a bottle. The time interval will reset as soon as the sample cycle starts. At the end of the second hour the spout will advance and another sample will be taken and deposited. This will continue until the total number of bottles the unit is configured for (set in *99) each have 1 sample placed in them or a bottle full condition occurs. The sequence will then be finished and the unit will stop operation waiting for the same or a new program to be entered. For example, if the sampler was configured for 24 bottles, the sampler would place 1 sample in each bottle, over a 24 hour period for a total of 24 samples, and then stop operation.

Display on LCD

<table>
<thead>
<tr>
<th>TIME TO NEXT SAMPLE</th>
<th>04:30:02</th>
</tr>
</thead>
</table>

This display indicates the sampler is ready to program and displays the current time. Press the * key to begin programming.

<table>
<thead>
<tr>
<th>ENTER * MODE</th>
<th>04:30:02</th>
</tr>
</thead>
</table>

At the ENTER * MODE prompt, press <START> to begin the * Start Mode.

<table>
<thead>
<tr>
<th>TIME TO NEXT SAMPLE</th>
<th>01:00</th>
<th>04:30:02</th>
</tr>
</thead>
</table>

The sampler is automatically programmed and the display will show the time (in HH:MM format) until the next sample.
Time Mode - Single Time Interval

This mode is similar to * START except the user sets the Time Interval instead of having it automatically set to 1 hour. The user enters a time in HH:MM format from 1 minute to 99 hours and 59 minutes. This time interval is used to initiate each sampling sequence in this program until the sampler ends its cycle and/or is re-programmed. After the time interval is entered and the program has been initiated by pressing <START>, the sampler will begin counting down the time interval. When the interval has elapsed, the unit will advance the spout, draw 1 sample, and place it in a bottle. The timer will reset as soon as the sample cycle starts and will immediately begin counting down the same time interval again. After the interval has elapsed again, the spout will advance and another sample will be taken and deposited. This will continue until the total number of bottles the unit is configured for (set in *99) each have 1 sample placed in them or a bottle full condition occurs. For example, if the time interval is set for 1 hour 30 minutes, the sampler would count down 1 hour and 30 minutes, advance the spout, take the first sample, and reset the timer. After another 1 hour and 30 minutes the spout would advance to bottle 2, the sampler would take a sample and reset the timer, etc.

*15 Time Mode - Active Sampling Period

This mode is similar to TIME MODE - SINGLE TIME INTERVAL, but *15 allows the operator to program an active sampling period (range 00:00 to 99:59) that will terminate sampling when the active sampling period has expired. The active time period does not start counting down until a sampling program has been entered and a sample triggered. If the operator enters a delay start time, then the active sampling period does not start until the delay start time has expired and a sample is attempted. When the active time period expires (counts down to 00:00) the next time a sample is attempted a message will be displayed indicating the active time period has expired and no sample will be taken. An active time period expired message will be logged.

If an end of sequence even (such as a bottle full) occurs before the active sampling period expires, then the active time period will have no effect. If the active time period expires while a sample is in process the sample will be completed and no more samples will be taken. There are two methods to clear an active time period. First, reset the sampler by pressing <RESET> twice. This will initiate a WARM START and set the active time to 00:00. The second method is to enter the *15 mode and enter a time of 00:00. The “A” will disappear from the second line indicating no active time period is active. For sampling situations where an active sampling period is not desired the operator will not enter an active time value.

The major use of the active sampling period will be in industrial monitoring situations where (as dictated by the EPA) a valid sample period cannot be longer than 24 hours. For example, if an active sampling period of 24 hours is required, then the operator would enter (starting from the SAMPLER READY display) the *15 mode. The software will prompt the operator to enter the active time period. The operator enters an ACTIVE TIME PERIOD of 24:00. An “A” will appear in position seven on the bottom of the two line by twenty character display indicating an active time has been entered. The operator then enters a sampling program (time, flow, etc.).

Flow Mode

Flow Modes differ from Time Modes in that instead of taking a sample after a time interval has elapsed, the unit will take samples after receipt of a contact closure from an external device. Whether those contact closures are based off Flow, pH, Level, ORP, DO, etc. is transparent to the sampler. The unit simply acknowledges a contact closure was received and that in turn triggers the sample collection process. In FLOW Mode the sampler does not control totalization, logging, or the meeting of certain parameters, etc. so they must be done by the external device. Once the parameters have been met, a contact closure will be output to the sampler. Every time a contact closure is received, the sample collection process is initiated. The sampler will advance the spout, draw 1 sample and place it in a bottle. It will then wait for the next contact closure while displaying a running tally indicating the number of samples taken to that point. This will continue until the total number of bottles the unit is configured for (set in *99) each have a sample placed in them or a bottle full condition occurs. If either of these two conditions occur, the sampler ends the program. NOTE: If the contact is closed at the end of the sample cycle, the controller reverts to the * Start Time Mode and takes 1 sample per hour until all bottles have a sample in them or a bottle full condition occurs. The sampler will remain in the * Start Time Mode, even if the external contact opens later.

</tbody>
</table>
Flow Mode - Pulse Accumulation

FLOW Mode - Pulse Accumulation operates the same as FLOW Mode except instead of taking a sample after every contact closure, a sample is taken after a set number of contact closures (from 2 - 9,999) have been accumulated. **NOTE:** This program uses <DELAY START> for setting the number of contact closures to be accumulated. The display will show the number of contact closures the sampler is programmed to accumulate before taking a sample. Every time a contact closure is received, the sampler will decrease the number needed on the display by one. This shows how many more contacts have yet to be accumulated before a sample is taken. Once the set number of contact closures are received, the sampler will advance the spout, draw 1 sample and then place it in a bottle. It will then wait for the next accumulation. This will continue until the total number of bottles the unit is configured for (set in *99) each have a sample placed in them or a bottle full condition occurs. If, either of these two conditions occur, the sampler ends the program. **NOTE:** If the contact is closed at the end of the sample cycle, the controller reverts to the * Start Time Mode and takes 1 sample per hour until all bottles have a sample in them or a bottle full condition occurs. The sampler will remain in the * Start Time Mode, even if the external contact opens later.

</tbody>
</table>
Analog Sampling Programs

*05 Flow Mode - Totalizing Analog

The *05 mode works much like FLOW mode except instead of relying on a contact closure, the sampler integrates and totalizes an analog signal (4-20mA, 0-20mA, 0-1V, or 1-5V DC) from an external device which represents flow rate. For more details on how the analog controller works, refer to the analog programming section on page 2-12. Since the sampler does not ask for a definition of the volume unit of the flow rate, ANY can be used, i.e. cubic feet, liters or gallons. Once the unit is programmed, it begins reading the analog signal once per minute to internally totalize and keep track of the volume. When the totalized flow rate matches the Sample Trigger Volume entered by the user, the sample collection process is initiated. The unit will advance the spout, take a sample and deposit it in the first bottle. Every time the totalized volume matches the Sample Trigger Volume, the sampler will take a sample and deposit it, and then move to the next bottle in sequence. The sampler will continue this pattern of depositing a sample in each bottle, until the total number of bottles the unit is configured for (set in *99) each have a sample placed in them or a bottle full condition occurs.

NOTE: In order for the sampler to correctly scale the analog signal being output from the external device, the parameters (in this case maximum and minimum flow) set in the sampler and the external device must be the same. This is to ensure that if the external device is reading 100,000 gallons and outputting a 4mA signal, the sampler will also know that 100,000 gallons is equal to 4mA. If the parameters do not correspond there is a risk that the sampler will potentially not scale the analog signal correctly and will subsequently not take samples at the anticipated or correct instances.

</tr>
<tr>
<td>__ __</td>
<td>04:30:02</td>
</tr>
<tr>
<td>MAXIMUM FLOW RATE?</td>
<td>Input the 4 most significant digits of the Maximum anticipated flow rate. Since the unit of measurement is generic it can stand for any volume/unit of time. If the flow rate is 40, it could be entered as: 4000, 0400, or 0040. The decimal point is implied, in each case, so be consistent with all entries.</td>
</tr>
<tr>
<td>__ __ __ __</td>
<td>04:30:02</td>
</tr>
<tr>
<td>MINIMUM FLOW RATE?</td>
<td>Enter the 4 most significant digits of the Minimum anticipated flow rate. The same criteria apply to this input as to Maximum Flow Rate.</td>
</tr>
<tr>
<td>__ __ __ __</td>
<td>04:30:02</td>
</tr>
</tbody>
</table>
The Flow Multiplier is used to scale the Maximum & Minimum Flow Rates. If the Max flow rate is 40,000, enter it as 4000 (first 4 significant digits). The user would then enter a Flow Multiplier of 10 (4000 x 10 = 40,000) to have the unit scale the flow rate as 40,000.

Enter the 4 most significant digits that tell the sampler at what accumulation of totalized flow a sample should be taken. Remember the decimal point is implied and must be consistent with previous entries. If the user wanted to take a sample at 150,000 units, the entry would be 1500.

The Trigger Multiplier is used to increase, if necessary, the Sample Trigger. Using the example above, if 150,000 units is the Trigger point, the Trigger Multiplier would be 100 (1500 x 100 = 150,000).

If no add-on options are desired, press <START> to begin the program.

The sampler is now waiting to take samples.
*06 Analog Level Mode

The *06 mode expands the capability of the sampler by allowing it to collect samples based on changing level parameters. The sampler is used in conjunction with an external device which outputs an analog signal (4-20mA) representing level (for more details on how the analog controller works, refer to the analog programming section on page 2-12). The sampler does not ask for a definition of this level unit, so ANY can be used, i.e. feet, meters, or inches. Once the unit is programmed and started, the sampler integrates the analog signal once per minute to internally track the water level. When the source water level rises above or falls below a Sampling Level, the sample collection process is initiated. The sampler will advance the spout, take a sample and deposit it in the first bottle. Every time a Sample Level is exceeded or passed after that, the sampler will take a sample, deposit it, and then move to the next bottle in sequence. The sampler will continue this pattern of depositing samples in each bottle until the total number of bottles the unit is configured for (set in *99) each have a sample placed in them or a bottle full condition occurs.

To use the *06 mode, the following entries must be entered:

**UPPER LEVEL LIMIT**
This is the highest anticipated level of the source liquid. It acts as a ceiling. If the water ever rises above the Upper Level Limit, the sampler considers the level as temporarily fixed at the highest Sampling Level (once the level falls below this point, normal program operation resumes). It is important to make sure the Upper Level Limit is high enough to prevent this from occurring.

**LOWER LEVEL LIMIT**
This is the lowest anticipated level of the source liquid. It acts as a floor. If it is possible for the level to drop below the Lower Level Limit, and it does, the sampler considers the level as temporarily fixed at the Lower Level Limit (once the level rises above this point, normal program operation resumes). It is important to make sure the Lower Level Limit is low enough to prevent this from occurring.

**SAMPLING LEVEL (1-32)**
These are the levels at which samples will be taken (up to 32 levels can be programmed). Enter the level as a 4-digit number. Remember the decimal point is implied, and must be consistent with previous ones. The unit of measure is generic so it can be feet, meters, etc. The * key will end data entry at any time if all 32 levels are not going to be entered.

The difference (delta) between the Upper Level Limit and the Lower Level Limit is called the span (or distance). In figure 2-2, the Upper Level Limit is 37 and the Lower Level Limit is 2.5, so the span is 34.5. The controller divides the span into 256 equal steps, with each step equal to 0.39% (1/256) of the total. The sampler will always display the next acceptable level. A level that is greater can be entered or the user can accept the displayed entry.

The lowest Sampling Level, must be greater than the Lower Level Limit and each successive level must be greater than the previous level. In figure 2-2, the Lower Level Limit is 2.5 and Sampling Level 1 is 4.0. The highest sampling level can be equal to the Upper Level Limit, although this is not necessary. If it is equal to the Upper Level Limit, it must be entered separately. In figure 2-2, the highest sampling level is equal to the Upper Level Limit so it is entered as Sampling Level 7. Press <START> to begin the program.
NOTE: In order for the sampler to correctly scale the analog signal being output from the external device, the parameters (in this case Upper Level Limit and Lower Level Limit) set in the sampler and the external device must be the same. This is to ensure that if the external device is reading 10 feet and outputting a 4mA signal, the sampler will also know that 10 feet is equal to 4mA. If the parameters do not correspond, there is a risk that the sampler will potentially not scale the analog signal correctly and will subsequently not take samples at the anticipated or correct instances.

Continue to enter 4-digit numbers for Sampling Levels (up to 32 levels) remembering that each subsequent level must be greater than the proceeding one and that the decimal point is implied and must be consistent with previous entries. The user can end data entry at any point by pressing the * key.

### PUSH START/OPTIONS
---
If no add-on options are desired, press <START> to begin the program.

### FLOW MODE (* 06)
---
The sampler will immediately begin reading the analog signal.
*09 Hydrologic Level Event Mode

(Storm Water Sampling)

The *09 mode is used primarily for Storm Water Sampling, although it can be used to sample in any situation where there are rising and falling levels. The sampler is used in conjunction with an external device which outputs an analog signal (4-20mA, 0-20mA, 0-1V, or 1-5V DC) representing level (for more details on how the analog controller works, refer to the analog programming section on page 2-12). The sampler does not ask for a definition of this level so ANY can be used, i.e. feet, meters, or inches. After the unit has been programmed and started, it reads the analog signal once per minute to internally track the water level. Sampling does not begin until the source water level reaches Sampling Level 1. Once this has occurred, a sample is taken and the Time Override for Sampling Level 1 begins counting down. After Sampling Level 1 is reached, *09 Mode has 3 ways to trigger a sample:

1) When the analog signal corresponds to a Sampling Level.
2) The rise or fall of the water level by a user set amount (Rising or Falling Delta).
3) When the Time Override has elapsed if there has not been a large enough increase or decrease in water level or another Sampling Level has not been reached.

If any of these occur, the sampler will advance the spout, take a sample and deposit it in the first bottle. The sampler will continue this pattern of depositing samples in each bottle, until the total number of bottles the unit is configured for (set in *99) each have a sample placed in them or a bottle full condition occurs. If either of the first two triggering conditions is met (the analog signal corresponding to a Sampling Level or a Rising or Falling Delta), the Time Override is reset, and begins counting down again. A different Time Override can be set for each level entered. Each Time Override is only active in that portion or range of the total span that corresponds to its Sampling Level. Time Override 4 is active from the start of Sampling Level 4 to the beginning of Sampling Level 5.

The following entries are required. See figure 2-3 for an example.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper Level Limit</td>
<td>Maximum Analog Level (hydrologic high point) 100% of span.</td>
</tr>
<tr>
<td>Lower Level Limit</td>
<td>Minimum Analog level (hydrologic low point). 0% of span. The difference between the Upper Level Limit and the Lower Level Limit is the span.</td>
</tr>
<tr>
<td>Rising (positive) Delta</td>
<td>Rising change in water level, resulting in a sample. NOTE: The user can enter only 1 Rising Delta for the duration of the program.</td>
</tr>
<tr>
<td>Falling (negative) Delta</td>
<td>Falling change in water level, resulting in a sample. NOTE: The user can enter only 1 Falling Delta for the duration of the program.</td>
</tr>
<tr>
<td>Sampling Level 1</td>
<td>Water level at which the first sample will be taken, and which is associated with Time Override 1.</td>
</tr>
<tr>
<td>Time Override 1</td>
<td>Time Override to the next sample in the range. Causes a sample to be taken if the Rising or Falling Delta, or Sampling Level 2 has not been met within the override time. It will reset after a sample is taken.</td>
</tr>
<tr>
<td>Sampling Level 2-6</td>
<td>Subsequent higher levels at which samples will be taken.</td>
</tr>
</tbody>
</table>
Time Override 2-6  Subsequent Time Overrides that correspond to the equivalent Sampling Level.

The difference (delta) between the Upper Level Limit and the Lower Level Limit is called the span (or distance). In figure 2-3, the Upper Level Limit is 65 and the Lower Level Limit is 4, so the span is 61. The controller divides the span into 256 equal steps, with each step equal to .39% (1/256) of the total. If a level which is not a multiple of 1/256 is entered, the controller will indicate an acceptable entry. Up to 6 levels can be entered, however data entry can be stopped at any time by pressing the * key. After the * key is pressed, the LCD will prompt the user to either start the Program or add-on other options.

NOTE: In order for the sampler to correctly scale the analog signal being output from the external device, the parameters (in this case Upper Level Limit and Lower Level Limit) set in the sampler and the external device must be the same. This is to ensure that if the external device is reading 10 feet and outputting a 4mA signal, the sampler will also know that 10 feet is equal to 4mA. If the parameters do not correspond, there is a risk that the sampler will potentially not scale the analog signal correctly and will subsequently not take samples at the anticipated or correct instances.

Figure 2-3 The *09 Storm Water Sampling Mode
This display indicates the sampler is ready to program and displays the current time. Press the * key to begin programming.

The sampler is now prompting for a star mode to be input. Enter the numbers which represent the star mode of choice, in this example 09, and press <ENTER>.

Enter the Upper Level Limit as a 4-digit number. Remember the decimal is implied in this program and the unit of measure is generic, so if the entry were to be 10 feet/meters/inches/millimeters, it could be entered as 0010, 0100, or 1000. Be CONSISTENT in all entries throughout the program.

Enter the Lower Level Limit as a 4-digit number. Remember to be consistent with the implied decimal from previous entries.

Enter a 4-digit number which represents the rising change in water level that will trigger a sample to be taken. If the rise of the water is equal to or greater than this number a sample will be taken.

Enter a 4-digit number which represents the falling change in water level that will trigger a sample to be taken. If the fall of the water is equal to or greater than this number a sample will be taken.

Enter a 4-digit number that represents the lowest level at which a sample is to be taken. Must be greater than the Lower Level Limit. Remember to be consistent with the implied decimal from previous entries.

Enter a time in HH:MM format. This is the amount of time after Sampling Level 1 during which the sampler waits for an event (Rising or Falling Delta, Sampling Level 2 reached, etc.). If no event occurs before the interval is done, a sample will be taken. If an event occurs, the Time Override will reset, or move to Time Override 2 if Sampling Level 2 has been reached.

Enter a 4-digit number representing the next level at which a sample should be taken, keeping consistent with the implied decimal point in previous entries. A sample will be taken when the water level rises to this point. Must be greater than Sampling Level 1.

Enter a time in HH:MM format. Operates on the same principal as Time Override 1.
Enter a 4-digit number. Operates the same as previous Sampling Levels.

Enter a time in HH:MM format. Operates on the same principal as Time Override 1. Continue to enter Levels and Times for up to 6 levels. Data entry can be ended at any time by pressing the * key. The last level can be equal to the Upper Level Limit but it is not necessary. If it is equal it must be entered separately.

If no add-on options are desired, press <START> to begin the program.

The sampler will immediately begin reading the analog signal.

## Maintenance

### Suggested Maintenance Schedule

The GC sampler requires only minimal maintenance to ensure proper and reliable operation. The following is a listed of suggested maintenance items and estimated times for accomplishing those tasks. Your actual times and needs may differ.

<table>
<thead>
<tr>
<th>Plan</th>
<th>Item</th>
<th>Frequency</th>
<th>Time</th>
<th>Description of Maintenance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maintenance</td>
<td>Lubrication</td>
<td>Only as needed</td>
<td>10 min</td>
<td>The peristaltic pump requires no regular lubrication.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Pump Tubing</td>
<td>Every Week</td>
<td>1 min</td>
<td>See Below.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Pump Case</td>
<td>Every Month</td>
<td>3 min</td>
<td>Manning recommends occasional cleaning to remove particulates that if caught between the wall and the tube, can cause increased wear of the pump tubing. Do not apply any oil or other lubricating substances to the pump body as this will inhibit the ability of the pump to operate correctly and will significantly impact the life of the pump tubing.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Pump Rollers</td>
<td>Every Month</td>
<td>2 min</td>
<td>Manning recommends occasional cleaning to ensure smooth rolling and less wear of pump tubing.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Clear Pump Lid</td>
<td>Every Month</td>
<td>3 min</td>
<td>Check to ensure that the clear lid is clean of residual materials and contaminants so that the operation of the pump can be clearly seen.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Strainer</td>
<td>Every Week</td>
<td>10min</td>
<td>Ensure that the strainer is not collecting materials that would inhibit fluid from reaching the pump. If material is collecting, clean the strainer and reposition at the appropriate spot in the flow stream.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Intake tubing connectors</td>
<td>Every Week</td>
<td>4 min</td>
<td>Ensure that the connectors are fitting tightly together. This ensures the sampler is not experiencing vacuum leaks which can degrade the samplers performance.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Liquid Sensor</td>
<td>Every Week</td>
<td>2 min</td>
<td>Inspect the liquid sensor. Continuity Type - Make sure that good connection is being made on the continuity sensor. Check to make sure that no foreign matter is making a connection between the leads. Cleaning of the inside of the sensor is recommended to ensure good continuity is maintained for the detection of liquid. Ultrasonic - Make sure that good contact is being made between the tubing and the ultrasonic sensors. The tubing should be seated firmly in the sensor block with the tubing in solid contact with the walls of the sensor.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Intake tubing</td>
<td>Every Month</td>
<td>10 min</td>
<td>Check the intake tubing to ensure that it is clean. Cleaning can be accomplished by running a cleaning solution through the tubing by using the test cycle feature of the unit.</td>
</tr>
</tbody>
</table>
## Maintenance Model GC

<table>
<thead>
<tr>
<th>Inspection Maintenance</th>
<th>Discharge Tubing</th>
<th>Every Month</th>
<th>3 min</th>
<th>Examine the discharge tubing for build up of organic and particulate matter. If there is build up, follow the same procedure for cleaning the intake tubing. Replace as necessary.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inspection Maintenance</td>
<td>Electronics Enclosure</td>
<td>Every Month</td>
<td>2 min</td>
<td>Clean as needed with warm water and very mild soap.</td>
</tr>
<tr>
<td>Inspection Maintenance</td>
<td>Keypad</td>
<td>Every Month</td>
<td>2 min</td>
<td>Clean as needed with warm water and very mild soap. Harsh abrasive cleaning products can damage the keypad and scratch the clear window to the display</td>
</tr>
<tr>
<td>Inspection Maintenance</td>
<td>Sealing Gasket</td>
<td>Every Year</td>
<td>5 min</td>
<td>Unscrew the electronics enclosure from the refrigeration system and ensure that the gasket is free from debris and is maintaining its shape and consistency. If the gasket is exhibiting signs of wear, contact the Manning service department for information on replacement. Under normal operating conditions, the gasket should provide many years of life</td>
</tr>
<tr>
<td>Inspection Maintenance</td>
<td>Sample Bottles</td>
<td>As often as needed</td>
<td>15 min</td>
<td>The sample bottles should be checked frequently to ensure that they are clean. EPA cleaning protocol should be used in the cleaning of the bottles.</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Z-Rust Capsule</td>
<td>Every Year</td>
<td>8 min</td>
<td>Once a year, the Z-rust capsule which is used to absorb moisture (in the form of humidity) should be replaced</td>
</tr>
<tr>
<td>Maintenance</td>
<td>Lithium Battery</td>
<td>Every 3-5 years</td>
<td>12 min</td>
<td>The sampler contains an internal lithium battery which should be replaced every 3 to 5 years</td>
</tr>
</tbody>
</table>

### Peristaltic Pump

The peristaltic pump used in the Manning Environmental Inc. GC is designed for long life and trouble free service. The following is a list of routine maintenance items:

- Clean around inside of pump to remove particulate matter which can decrease pump tube life.
- Clean pump rollers of particulate matter which can decrease pump tube life.
Lubrication | The peristaltic pump requires no regular lubrication. If chattering starts to occur in the pump rollers, a very small amount of very lightweight oil may be applied. If the chattering does not stop, replacement may be necessary.
---|---
Pump Tubing | See Below.
Pump Case | Manning recommends occasional cleaning to remove particulates that if caught between the wall and the tube, can cause increased wear of the pump tubing.
Pump Rollers | Manning recommends occasional cleaning to ensure smooth rolling and less wear of pump tubing.

**Replacement of Pump Tubing**

**WARNING:** Always disconnect the power to the sampler before opening the pump to replace the tubing. Failure to do so may lead to serious injury.

The peristaltic pump used on the Manning Environmental Inc. Model GC has been designed to facilitate the changing of pump tubing. The unit is mounted in a vertical position. The unit also employs a clear plastic face plate to allow the user not only to see how the tubing should lie within the pump but also to aid in tubing alignment and to allow the user to visually verify that the pump is operating correctly. Perform the following steps to change the pump tubing:

**WARNING:** The orientation of the intake and discharge hoses must not change when replacing the tubing. If the orientation changes, the unit will operate in reverse of its proper operating procedure. This means it will try to draw a sample out of the sample container instead of out of the source liquid.

1) Verify there is no power being applied to the unit. The unit has an integral safety kill switch which is intended to prevent powered rotation to the pump should the clear plastic face plate be removed. However, power should always be turned off to the unit as an added measure of safety.

2) Remove the 3 thumb screws which hold down the clear plastic face plate. Lift off the plate.

3) Remove the tubing from the liquid connectors which are attached to the liquid sensor (continuity type). For ultrasonic type liquid sensors, disconnect the tubing from the liquid connectors and then...
slide the hinged lid of the top of the liquid sensor and then pull the tubing out of the liquid sensor. Then remove the tubing from around the rollers. There are no designated ends on the tubing so the orientation (which end is placed on the inlet side and which end is placed on the outlet side) does not matter.

4) Place the new tube in the pump making sure it is seated flush against the inside wall of the pump. Pushing on the tube to get it flush against the back wall of the pump will help. It should follow the curve of the cavity with no gaps between the tubing and the wall and have equal amounts of tubing extending out past the pump housing.

5) Once the tube is back in place, reconnect the tube to the liquid connectors or in the case of the ultrasonic sensor, replace the tube in the sensor, making sure that is seated in the bottom of the sensor and that good contact is made with both walls of the sensor. Close the hinged lid and secure. Re-install the clear plastic face plate and tighten it securely with the 3 thumb screws removed earlier. Do not overtighten the screws. The face plate is made from clear material to aid in confirming that the pump tubing is correctly installed. Now that the cover is back on, look through it and make sure the tubing still follows the curve of the pump cavity with no gaps. Also verify that equal lengths of the tube extend out both the inlet and outlet sides of the pump. Insert the connectors back into the ends of the pump tubing making sure to maintain the orientation of the intake and discharge lines. Run a test cycle and check to see that when the pump is turning that the tubing is staying in place within the pump and that it is not “riding” up or down. If the tubing is “riding up or down, you can affect this by twisting the tubing at the inlet to the pump either clockwise or counterclockwise as the pump is turning. You should see the tubing either go up or down when twisted. Twist it till the tubing is centered between the rollers and stays there when the pump is going forward or backward.

6) Reset the tube life pump count in *19. A peristaltic units ability to operate and perform to specifications, such as transport velocity and lift height is, to a certain extent, determined by the medical grade silicone rubber pump tubing used in the system. The characteristics of the tubing change as it wears. It becomes less resilient, less able to maintain its shape, develops pinch points on the outside edge of the tube, and as such is not capable of the performance it had when it was new. To maintain optimum performance, it is necessary to monitor the wear on the tube. *19 does this by enabling the operator to set a maximum number of pump revolutions, the tube currently in use, will be allowed to withstand. This, in effect, determines the tube’s useful life. Manning recommends not exceeding 1,000,000 pump revolutions for a singular tube as, by this time, there is risk that the tubing could fail causing a variety of problems. *19 should be used every time the pump tubing is changed. The user will be alerted to change the tubing, when the tubing reaches the number of counts set. The
warning will appear, every time the user executes a Program Mode, by pressing <START>. Since all programs are initiated by pressing <START> the warning will always appear, if appropriate, before the program is initiated. This allows the user the opportunity to exit the program and change the tubing. Once the tubing is changed, the user can re-enter the program and begin sampling.

When the pump tubing is to be changed, the user will enter into *19 Mode, just like entering any of the other * Modes. The sampler will prompt the operator to clear the current pump count by pressing 1, or to maintain the current count by pressing 0. It is advisable to reset the pump counts when changing the tubing so an accurate accounting of the number of revolutions, the tube in the pump has experienced, can be obtained. At this juncture the user will be asked to enter a number for the tube life warning which represents the number of revolutions the current tube will be allowed to accumulate before a warning is issued. Once entered, the system will return to the sampler ready prompt and the system will be ready to program.

<table>
<thead>
<tr>
<th>Display on LCD</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| **SAMPLER READY**
  04/30 04:30:02 | This display shows the sampler is ready to program. It displays the current time. From here the user can enter any TIME, FLOW, or * Mode. Press the * key to access the * Mode. |
| **ENTER * MODE?**
  __ __ 04:30:02 | Prompts the user to enter either a program or a * Mode. Press 19 and <ENTER> to proceed. |
| **0=MAINTAIN 1=CLEAR**
  __ 04:30:02 | This prompt is asking the user to determine how the system will handle the current accumulation of revolutions: |

0 - This maintains the current revolution count. This is useful if the operator wishes to increase the number of revolutions the current tubing can accumulate before a tube life warning is issued. For example, assume the current tubing has 200,000 revolutions. The operator really wants the warning to come on at 400,000. The 0 key would be pressed instead of 1 to maintain the history the tubing has already generated. The user would then enter 0400 (for 400,000) at the TUBE LIFE WARNING prompt (see below).

1 - This resets the current revolution count. This is necessary if the user is going to be placing brand new tubing into the system. With the counter reset the user knows exactly how many counts it will take for the sampler to issue a warning to change the tubing.
Enter the maximum number of revolutions the tubing will accept before the sampler issues a pump tube warning. The number entered is in terms of thousands (in other words it adds 3 0's to the end of the number entered) so if 0500 is entered, the sampler would see it as 500,000. Entering 4000 equals 4,000,000 and 0060 would be 60,000, etc. When the number of revolutions meet or exceed the pump counts set by the user, a pump life warning will be issued. The default is 1,000,000.

**Cleaning the Control Panel and Electronics Enclosure**

Use a mild cleaning solution and wipe with a soft, lint-free cloth. The clear window on the membrane keypad is easily scratched, so be very careful when cleaning. The exterior of the electronics enclosure is constructed of thick walled injection molded structural resin and is designed to withstand a wide variety of conditions. The unit conforms to NEMA 4X,6 criteria, when the unit is latched shut. Please be sure to close and latch the unit when not programming. This will ensure that the keypad is not exposed to the elements and will increase its useful life.

**CAUTION:** Do not use harsh cleaners (detergents, solvents, etc.) which can damage the panel surface. Do not use abrasives which can scratch the panel and fog the window above the LCD display.

**Cleaning the Wetted Parts**

**Note:** Solvents and solvent contaminated fluids must be disposed of according to approved procedures.

Manning Environmental Inc. recommends instituting a cleaning regime for the sampling equipment. The following are a few of the many reasons why a cleaning regime is important:

1. It validates that the samples taken will be as free as possible from constituents that are not contained within the sample itself.
2. It contributes to ensuring that the statistical validity of the samples being examined will be maximized by reducing systematic error, if the regime is followed very closely.
3. It contributes to the longevity of the sampling equipment.
4. It provides documentation for challenged results.
For a detailed description of a cleaning protocol refer to U.S. Environmental Protection Agency Publications EPA-600/4-77-039 ("Sampling of Water and Wastewater" by Dr. Phillip E. Shelley), or consult with the facility that will do the actual testing of the samples. They could probably assist in setting a cleaning regime that will help produce the most accurate results possible.

The following procedures are very general outlines of procedures for cleaning certain parts of the sampler:

**Intake Hose**

There are two types of intake hose used with the sampler - PVC and Teflon®. PVC intake hose is used for general purpose sampling (Non-Toxic) applications. Teflon® hose is used for priority pollutant sampling (Toxic) applications.

1. Remove the intake hose. Remove the strainer if necessary.

2. Wash the intake hose and strainer using a cleaning solution appropriate for the application. The use of methylene chloride or other solvents may leave a residue that could contaminate the sample. Use a test tube brush to scrub the internal surfaces of the strainer. Pull the brush through the hose with a wire to clean the internal surfaces of the hose.

3. Rinse the hose and strainer thoroughly in clean water (warm water is best) and reassemble.

It may be easier and more convenient to simply use a new hose for each sample configuration. This eliminates cleaning and disposal of potentially hazardous regulated chemicals.

**Liquid Sensor**

The continuity type liquid sensor will need to be cleaned occasionally. Like any piece of the sample tract, it has the ability to collect particulate matter, which needs to be removed. By removing this particulate matter, it ensures that you will receive optimum performance from the unit.

The ultrasonic liquid sensor will not need to be cleaned. By changing the pump tubing you in effect, clean, the ultrasonic sensor.

1. Remove the pump tubing from the liquid connectors.

2. Insert a bottle brush or other scrubbing type device and vigorously insert the scrubber in and out of the sensor.

3. Reconnect the pump tubing to the liquid connectors and run a manual cycle with clean water to flush any material that was removed from the liquid sensor out of the sample tract.
Bottle Full Sensor

1. Locate the bottle full sensor in the neck of the bottle. Either remove the leads from the ends of the bottle full sensor probes or disconnect the black rubber mating connector. Remove the bottle full sensor from the discharge line by sliding it off.

2. The unit is made of high grade stainless steel which is approved by the EPA for toxic or non-toxic applications. Clean the probes, ensuring that there is no buildup on the stainless steel probes.

3. Reconnect the unit, reversing the procedure used to remove it. If you disconnected the leads from the stainless steel probes, make sure they are firmly attached.

Sample Containers

1. Wash with the appropriate cleaning solution. Use a test tube brush to clean the internal surfaces.

2. Rinse thoroughly in clean water (warm water is best).

3. Autoclave glass bottles, if desired. Do not autoclave suspension rings, plastic bottles or caps since they are constructed of polyethylene.

Environmental Protection

Once a year (or as necessary) replace the Zerust sponge inside the enclosure. If the sampler is in an area of high humidity, additional desiccant may be necessary.

Removing and Replacing the Controller

To remove the controller, remove the hold down screws, lift the lid and detach the wires from the controller. To replace the controller, re-attach the wires, close the lid, secure the lid catches and tighten the hold down screws.
Trouble Shooting

Troubleshooting instructions are based on a logical sequence of events leading to a malfunction. If trouble occurs, look for the simplest solution first such as whether the power supply is connected. Are any connections loose or wires broken? Review the problem, normal operating procedures, and then check one possibility at a time starting with the easiest to verify. If the malfunction continues, call the Manning Environmental, Inc. Service Department at 1-800-863-9337. We can often assist over the phone. We can also advise on whether or not certain repairs are best done in the field or in our factory.
